## 1. DESCRIPTION

The S1D10605 Series is a series of single-chip dot matrix liquid crystal display drivers that can be connected directly to a microprocessor bus. 8-bit parallel or serial display data sent from the microprocessor is stored in the internal display data RAM and the chip generates a liquid crystal drive signal independent of the microprocessor. Because the chips in the S1D10605 Series contain  $65 \times 132$  bits of display data RAM and there is a 1-to-1 correspondence between the liquid crystal panel pixels and the internal RAM bits, these chips enable displays with a high degree of freedom.

The S1D10606 Series chips contain 65 common output circuits and 132 segment output circuits, so that a single chip can drive a  $65 \times 132$  dot display (capable of displaying 8 columns  $\times$  4 rows of a  $16 \times 16$  dot kanji font). The S1D10607 Series chips contain 33 common output circuits and 132 segment output circuits, so that a single chip can drive  $33 \times 132$  dot display (capable of displaying 8 columns  $\times$  2 rows of  $16 \times 16$  dot kanji fonts). Thanks to the built-in 55 common output circuits and 132 segment output circuits, the S1D10608 Series is capable of displaying  $55 \times 132$  dots (11 columns  $\times$  4 lines using  $11 \times 12$  dots Kanji font) with a single chip. The S1D10609 Series chips contain 53 common output circuits and 132 segment output circuits, so that a single chip can drive  $53 \times 132$  dot display (capable of displaying 11 columns  $\times$  4 rows of  $11 \times 12$  dot kanji fonts). Moreover, the capacity of the display can be extended through the use of master/slave structures between chips.

The chips are able to minimize power consumption because no external operating clock is necessary for the display data RAM read/write operation. Furthermore, because each chip is equipped internally with a low-power liquid crystal driver power supply, resistors for liquid crystal driver power voltage adjustment and a display clock CR oscillator circuit, the S1D10605 Series chips can be used to create the lowest power display system with the fewest components for high-performance portable devices.

## 2. FEATURES

- Direct display of RAM data through the display data RAM.  
RAM bit data: "1" Display on  
"0" Display off  
(during normal display)
- RAM capacity  
 $65 \times 132 = 8580$  bits
- Display driver circuits  
S1D10605\*\*\*\*\*: 65 common output and 132 segment outputs  
S1D10606\*\*\*\*\*: 49 common output and 132 segment outputs  
S1D10607\*\*\*\*\*: 33 common outputs and 132 segment outputs  
S1D10608\*\*\*\*\*: 55 common outputs and 132 segment outputs  
S1D10609\*\*\*\*\*: 53 common outputs and 132 segment outputs
- High-speed 8-bit MPU interface (The chip can be connected directly to the both the 80x86 series MPUs and the 6800 series MPUs)  
/Serial interfaces are supported.
- Abundant command functions  
Display data Read/Write, display ON/OFF, Normal/Reverse display mode, page address set, display start line set, column address set, status read, display all points ON/OFF, LCD bias set, electronic volume, read/modify/write, segment driver direction select, power saver, static indicator, common output status select, V5 voltage regulation internal resistor ratio set.
- Static drive circuit equipped internally for indicators. (1 system, with variable flashing speed.)
- Low-power liquid crystal display power supply circuit equipped internally.  
Booster circuit (with Boost ratios of Double/Triple/Quad, where the step-up voltage reference power supply can be input externally)  
High-accuracy voltage adjustment circuit (Thermal gradient  $-0.05\%/^{\circ}\text{C}$ )  
V5 voltage regulator resistors equipped internally, V1 to V4 voltage divider resistors equipped internally, electronic volume function equipped internally, voltage follower.
- CR oscillator circuit equipped internally (external clock can also be input)
- Extremely low power consumption  
Operating power when the built-in power supply is used (an example)  
S1D10605D00B\* 100  $\mu\text{A}$  ( $V_{\text{DD}} - V_{\text{SS}} = V_{\text{DD}} - V_{\text{SS}2} = 3.0 \text{ V}$ , Quad voltage, V5 -  $V_{\text{DD}} = -11.0 \text{ V}$ )  
S1D10606D00B\* 59  $\mu\text{A}$  ( $V_{\text{DD}} - V_{\text{SS}} = V_{\text{DD}} - V_{\text{SS}2} = 3.0 \text{ V}$ , Triple voltage, V5 -  $V_{\text{DD}} = -8.0 \text{ V}$ )  
S1D10607D00B\* 55  $\mu\text{A}$  ( $V_{\text{DD}} - V_{\text{SS}} = V_{\text{DD}} - V_{\text{SS}2} = 3.0 \text{ V}$ , Triple voltage, V5 -  $V_{\text{DD}} = -8.0 \text{ V}$ )  
S1D10608D00B\* 58  $\mu\text{A}$  ( $V_{\text{DD}} - V_{\text{SS}} = V_{\text{DD}} - V_{\text{SS}2}$   
/S1D10609D00B\*  $V_{\text{SS}2} = 3.0 \text{ V}$ , Triple voltage, V5 -  $V_{\text{DD}} = -8.0 \text{ V}$ )  
Conditions: When all displays are in white and the normal mode is selected (see page 60 \*12 for details of the conditions).
- Power supply  
Operable on the low 1.8 voltage  
Logic power supply  $V_{\text{DD}} - V_{\text{SS}} = +1.8 \text{ V}$  to  $-3.6 \text{ V}$   
Boost reference voltage:  $V_{\text{DD}} - V_{\text{SS}2} = 1.8 \text{ V}$  to  $-4.0 \text{ V}$   
Liquid crystal drive power supply:  $V_{\text{DD}} - V_5 = -4.5 \text{ V}$  to  $-14.0 \text{ V}$
- Wide range of operating temperatures:  $-40$  to  $+85^{\circ}\text{C}$
- CMOS process
- Shipping forms include bare chip and TCP.
- These chips not designed for resistance to light or resistance to radiation.

## S1D10605 Series

### Series Specifications

Product name	Duty	Bias	SED	COM	V <sub>REG</sub> temperature gradient	Reset pin noise rejection	Chip Thickness

## 6. PIN DESCRIPTIONS

### Power Supply Pins

Pin Name	I/O	Function	No. of Pins																														
VDD	Power Supply	Shared with the MPU power supply terminal Vcc.	13																														
VSS	Power Supply	This is a 0V terminal connected to the system GND.	9																														
VSS2	Power Supply	This is the reference power supply for the step-up voltage circuit for the liquid crystal drive.	4																														
VRS	Power Supply	This is the externally-input VREG power supply for the LCD power supply voltage regulator. These are only enabled for the models with the VREG external input option.	2																														
V1, V2, V3, V4, V5	Power Supply	This is a multi-level power supply for the liquid crystal drive. The voltage applied is determined by the liquid crystal cell, and is changed through the use of a resistive voltage divider or through changing the impedance using an op. amp. Voltage levels are determined based on VDD, and must maintain the relative magnitudes shown below.  $V_{DD} (= V_0) \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$  Master operation: When the power supply turns ON, the internal power supply circuits produce the V1 to V4 voltages shown below. The voltage settings are selected using the LCD bias set command. <table border="1" data-bbox="421 1070 1337 1240"> <thead> <tr> <th></th> <th>S1D10605*****</th> <th>S1D10606*****</th> <th>S1D10607*****</th> <th>S1D10608*****</th> <th>S1D10609*****</th> </tr> </thead> <tbody> <tr> <td>V1</td> <td>1/9•V5 1/7•V5</td> <td>1/8•V5 1/6•V5</td> <td>1/6•V5 1/5•V5</td> <td>1/8•V5 1/6•V5</td> <td>1/8•V5 1/6•V5</td> </tr> <tr> <td>V2</td> <td>2/9•V5 2/7•V5</td> <td>2/8•V5 2/6•V5</td> <td>2/6•V5 2/5•V5</td> <td>2/8•V5 2/6•V5</td> <td>2/8•V5 2/6•V5</td> </tr> <tr> <td>V3</td> <td>7/9•V5 5/7•V5</td> <td>6/8•V5 4/6•V5</td> <td>4/6•V5 3/5•V5</td> <td>6/8•V5 4/6•V5</td> <td>6/8•V5 4/6•V5</td> </tr> <tr> <td>V4</td> <td>8/9•V5 6/7•V5</td> <td>7/8•V5 5/6•V5</td> <td>5/6•V5 4/5•V5</td> <td>7/8•V5 5/6•V5</td> <td>7/6•V5 5/6•V5</td> </tr> </tbody> </table>		S1D10605*****	S1D10606*****	S1D10607*****	S1D10608*****	S1D10609*****	V1	1/9•V5 1/7•V5	1/8•V5 1/6•V5	1/6•V5 1/5•V5	1/8•V5 1/6•V5	1/8•V5 1/6•V5	V2	2/9•V5 2/7•V5	2/8•V5 2/6•V5	2/6•V5 2/5•V5	2/8•V5 2/6•V5	2/8•V5 2/6•V5	V3	7/9•V5 5/7•V5	6/8•V5 4/6•V5	4/6•V5 3/5•V5	6/8•V5 4/6•V5	6/8•V5 4/6•V5	V4	8/9•V5 6/7•V5	7/8•V5 5/6•V5	5/6•V5 4/5•V5	7/8•V5 5/6•V5	7/6•V5 5/6•V5	10

### LCD Power Supply Circuit Terminals

Pin Name	I/O	Function	No. of Pins
CAP1+	O	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP1– terminal.	2
CAP1–	O	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP1+ terminal.	2
CAP2+	O	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP2– terminal.	2
CAP2–	O	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP2+ terminal.	2
CAP3–	O	DC/DC voltage converter. Connect a capacitor between this terminal and the CAP1+ terminal.	2
VOUT	O	DC/DC voltage converter. Connect a capacitor between this terminal and Vss.	2
VR	I	Output voltage regulator terminal. Provides the voltage between VDD and V5 through a resistive voltage divider. These are only enabled when the V5 voltage regulator internal resistors are not used (IRS = LOW). These cannot be used when the V5 voltage regulator internal resistors are used (IRS = HIGH).	2

## System Bus Connection Terminals

Pin Name	I/O	Function	No. of Pins															
D7 to D0 (SI) (SCL)	I/O	This is an 8-bit bi-directional data bus that connects to an 8-bit or 16-bit standard MPU data bus. When the serial interface is selected (P/S = LOW), then D7 serves as the serial data input terminal (SI) and D6 serves as the serial clock input terminal (SCL). At this time, D0 to D5 are set to high impedance. When the chip select is inactive, D0 to D7 are set to high impedance.	8															
A0	I	This is connect to the least significant bit of the normal MPU address bus, and it determines whether the data bits are data or a command. A0 = HIGH: Indicates that D0 to D7 are display data. A0 = LOW: Indicates that D0 to D7 are control data.	1															
$\overline{\text{RES}}$	I	When $\overline{\text{RES}}$ is set to LOW, the settings are initialized. The reset operation is performed by the $\overline{\text{RES}}$ signal level.	1															
$\overline{\text{CS1}}$ CS2	I	This is the chip select signal. When $\overline{\text{CS1}} = \text{LOW}$ and CS2 = HIGH, then the chip select becomes active, and data/command I/O is enabled.	2															
$\overline{\text{RD}}$ (E)	I	<ul style="list-style-type: none"> <li>When connected to an 8080 MPU, this is active LOW. This pin is connected to the <math>\overline{\text{RD}}</math> signal of the 8080 MPU, and the S1D10605 series data bus is in an output status when this signal is LOW.</li> <li>When connected to a 6800 Series MPU, this is active HIGH. This is the 6800 Series MPU enable clock input terminal.</li> </ul>	1															
$\overline{\text{WR}}$ ( $\overline{\text{R/W}}$ )	I	<ul style="list-style-type: none"> <li>When connected to an 8080 MPU, this is active LOW. This terminal connects to the 8080 MPU <math>\overline{\text{WR}}</math> signal. The signals on the data bus are latched at the rising edge of the <math>\overline{\text{WR}}</math> signal.</li> <li>When connected to a 6800 Series MPU: This is the read/write control signal input terminal. When <math>\overline{\text{R/W}} = \text{HIGH}</math>: Read. When <math>\overline{\text{R/W}} = \text{LOW}</math>: Write.</li> </ul>	1															
C86	I	This is the MPU interface switch terminal. C86 = HIGH: 6800 Series MPU interface. C86 = LOW: 8080 MPU interface.	1															
P/S	I	<p>This is the parallel data input/serial data input switch terminal. P/S = HIGH: Parallel data input. P/S = LOW: Serial data input. The following applies depending on the P/S status:</p> <table border="1" style="margin-left: auto; margin-right: auto;"> <thead> <tr> <th>P/S</th> <th>Data/Command</th> <th>Data</th> <th>Read/Write</th> <th>Serial Clock</th> </tr> </thead> <tbody> <tr> <td>HIGH</td> <td>A0</td> <td>D0 to D7</td> <td><math>\overline{\text{RD}}</math>, <math>\overline{\text{WR}}</math></td> <td></td> </tr> <tr> <td>LOW</td> <td>A0</td> <td>SI (D7)</td> <td>Write only</td> <td>SCL (D6)</td> </tr> </tbody> </table> <p>When P/S = LOW, D0 to D5 are HZ. D0 to D5 may be HIGH, LOW or Open. <math>\overline{\text{RD}}</math> (E) and <math>\overline{\text{WR}}</math> (<math>\overline{\text{P/W}}</math>) are fixed to either HIGH or LOW. With serial data input, RAM display data reading is not supported.</p>	P/S	Data/Command	Data	Read/Write	Serial Clock	HIGH	A0	D0 to D7	$\overline{\text{RD}}$ , $\overline{\text{WR}}$		LOW	A0	SI (D7)	Write only	SCL (D6)	1
P/S	Data/Command	Data	Read/Write	Serial Clock														
HIGH	A0	D0 to D7	$\overline{\text{RD}}$ , $\overline{\text{WR}}$

## 7. FUNCTION DESCRIPTION

### The MPU Interface

#### Selecting the Interface Type

With the S1D10605 Series chips, data transfers are done through an 8-bit bi-directional data bus (D7 to D0) or through a serial data input (SI). Through selecting the P/S terminal polarity to the HIGH or LOW it is possible to select either parallel data input or serial data input as shown in Table 1.

Table 1

P/S	CS1	CS2	A0	RD	WR	C86	D7	D6	D5 to D0
HIGH: Parallel Input	$\overline{\text{CS1}}$	CS2	A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	C86	D7	D6	D5 to D0
LOW: Serial Input	CS1	CS2	A0	—	—	—	SI	SCL	(HZ)

“—” indicates fixed to either HIGH or to LOW

"(HZ)" means high-impedance state.

#### The Parallel Interface

When the parallel interface has been selected (P/S = HIGH), then it is possible to connect directly to either an 8080-system MPU or a 6800 Series MPU (as shown in Table 2) by selecting the C86 terminal to either HIGH or to LOW.

Table 2

P/S	CS1	CS2	A0	RD	WR	D7 to D0
HIGH: 6800 Series MPU Bus	$\overline{\text{CS1}}$	CS2	A0	E	$\overline{\text{R/W}}$	D7 to D0
LOW: 8080 MPU Bus	$\overline{\text{CS1}}$	CS2	A0	$\overline{\text{RD}}$	$\overline{\text{WR}}$	D7 to D0

Moreover, data bus signals are recognized by a combination of A0,  $\overline{\text{RD}}$  (E),  $\overline{\text{WR}}$  ( $\overline{\text{R/W}}$ ) signals, as shown in Table 3.

Table 3

Shared	6800 Series	8080 Series		Function	
		A0	R/W		RD
	1	1	0	1	Reads the display data
	0	1	1	0	Writes the display data
	1	0	0	1	Status read
	0	0	1	0	Write control data (command)

**The Serial Interface**

When the serial interface has been selected (P/S = LOW) then when the chip is in active state ( $\overline{CS1} = \text{LOW}$  and  $CS2 = \text{HIGH}$ ) the serial data input (SI) and the serial clock input (SCL) can be received. The serial data is read from the serial data input pin in the rising edge of the serial clocks D7, D6 through D0, in this order. This data is converted to 8 bits parallel data in the rising edge of the eighth serial clock for the processing.

The A0 input is used to determine whether or the serial data input is display data or command data; when  $A0 = \text{HIGH}$ , the data is display data, and when  $A0 = \text{LOW}$  then the data is command data. The A0 input is read and used for detection every 8th rising edge of the serial clock after the chip becomes active.

Figure 1 is a serial interface signal chart.

Figure 1

- \* When the chip is not active, the shift registers and the counter are reset to their initial states.
- \* Reading is not possible while in serial interface mode.
- \* Caution is required on the SCL signal when it comes to line-end reflections and external noise. We recommend that operation be rechecked on the actual equipment.

**The Chip Select**

The S1D10605 Series chips have two chip select terminals:  $\overline{CS1}$  and  $CS2$ . The MPU interface or the serial interface is enabled only when  $\overline{CS1} = \text{LOW}$  and  $CS2 = \text{HIGH}$ .

When the chip select is inactive, D0 to D7 enter a high impedance state, and the  $A0$ ,  $\overline{RD}$ , and  $\overline{WR}$  inputs are inactive. When the serial interface is selected, the shift register and the counter are reset.

**Accessing the Display Data RAM and the Internal Registers**

Data transfer at a higher speed is ensured since the MPU is required to satisfy the cycle time ( $t_{CYC}$ ) requirement alone in accessing the S1D10605 Series. Wait time may not be considered.

And, in the S1D10605 Series chips, each time data is sent from the MPU, a type of pipeline process between LSIs is performed through the bus holder attached to the internal data bus.

For example, when the MPU writes data to the display data RAM, once the data is stored in the bus holder, then it is written to the display data RAM before the next data write cycle. Moreover, when the MPU reads the display data RAM, the first data read cycle (dummy) stores the read data in the bus holder, and then the data is read from the bus holder to the system bus at the next data read cycle.

There is a certain restriction in the read sequence of the display data RAM. Please be advised that data of the specified address is not generated by the read instruction issued immediately after the address setup. This data is generated in data read of the second time. Thus, a dummy read is required whenever the address setup or write cycle operation is conducted.

This relationship is shown in Figure 2.

### The Busy Flag

When the busy flag is “1” it indicates that the S1D10605 Series chip is running internal processes, and at this time no command aside from a status read will be received. The busy flag is outputted to D7 pin with the read instruction. If the cycle time ( $t_{CYC}$ ) is maintained, it is not necessary to check for this flag before each command. This makes vast improvements in MPU processing capabilities possible.

Figure 2

## Display Data RAM

### Display Data RAM

The display data RAM is a RAM that stores the dot data for the display. It has a 65 (8 page × 8 bit + 1) × 132 bit structure. It is possible to access the desired bit by specifying the page address and the column address.

Because, as is shown in Figure 3, the D7 to D0 display data from the MPU corresponds to the liquid crystal display common direction, there are few constraints at the time of display data transfer when multiple S1D10605 series chips are used, thus and display structures can be created easily and with a high degree of freedom.

Moreover, reading from and writing to the display RAM from the MPU side is performed through the I/O buffer, which is an independent operation from signal reading for the liquid crystal driver. Consequently, even if the display data RAM is accessed asynchronously during liquid crystal display, it will not cause adverse effects on the display (such as flickering).

Figure 3

### The Page Address Circuit

As shown in Figure 4, page address of the display data RAM is specified through the Page Address Set Command. The page address must be specified again when changing pages to perform access.

Page address 8 (D3, D2, D1, D0 = 1, 0, 0, 0) is the page for the RAM region used only by the indicators, and only display data D0 is used.

### The Column Addresses

As is shown in Figure 4, the display data RAM column address is specified by the Column Address Set command. The specified column address is incremented (+1) with each display data read/write command. This allows the MPU display data to be accessed continuously.

Moreover, the incrementation of column addresses stops with 83H. Because the column address is independent of the page address, when moving, for example, from page 0 column 83H to page 1 column 00H, it is necessary to respecify both the page address and the column address.

Furthermore, as is shown in Table 4, the ADC command (segment driver direction select command) can be used to reverse the relationship between the display data RAM column address and the segment output. Because of this, the constraints on the IC layout when the LCD module is assembled can be minimized.

Table 4

SEG Output	SEG0	SEG 131
ADC "0"	0 (H) →	Column Address → 83 (H)
(D0) "1"	83 (H) ←	Column Address ← 0 (H)

### The Line Address Circuit

The line address circuit, as shown in Table 4, specifies the line address relating to the COM output when the contents of the display data RAM are displayed. Using the display start line address set command, what is normally the top line of the display can be specified (this is the COM0 output when the common output mode is normal, and the COM63 output for S1D10605 Series, COM47 output for S1D10606 Series, COM31 output for the S1D10607, COM53 output for the S1D10608 and COM51 output for the S1D10609 Series when the common output mode is reversed. The display area is a 65 line area for the S1D10605 Series, a 49 line area for the S1D10606, a 33 line area for the S1D10607, a 55 line area for the S1D10608 and a 53 line area for the S1D10609 from the display start line address.

If the line addresses are changed dynamically using the display start line address set command, screen scrolling, page swapping, etc. can be performed.

Figure 4

**The Display Data Latch Circuit**

The display data latch circuit is a latch that temporarily stores the display data that is output to the liquid crystal driver circuit from the display data RAM.

Because the display normal/reverse status, display ON/OFF status, and display all points ON/OFF commands control only the data within the latch, they do not change the data within the display data RAM itself.

**The Oscillator Circuit**

This is a CR-type oscillator that produces the display clock. The oscillator circuit is only enabled when M/S = HIGH and CLS = HIGH.

When CLS = LOW the oscillation stops, and the display clock is input through the CL terminal.

**Display Timing Generator Circuit**

The display timing generator circuit generates the timing signal to the line address circuit and the display data latch circuit using the display clock. The display data is latched into the display data latch circuit synchronized with the display clock, and is output to the data driver output terminal. Reading to the display data liquid crystal driver circuits is completely independent of accesses to the display data RAM by the MPU. Consequently, even if the display data RAM is accessed asynchronously during liquid crystal display, there is absolutely no adverse effect (such as flickering) on the display.

Moreover, the display timing generator circuit generates the common timing and the liquid crystal alternating current signal (FR) from the display clock. It generates a drive wave form using a 2 frame alternating current drive method, as is shown in Figure 5, for the liquid crystal drive circuit.

**Two-frame alternating current drive wave form (S1D10605\*\*\*\*\*)**

Figure 5

When multiple S1D10605 Series chips are used, the slave chips must be supplied the display timing signals (FR, CL,  $\overline{\text{DOF}}$ ) from the master chip[s].

Table 5 shows the status of the FR, CL, and  $\overline{\text{DOF}}$  signals.

Table 5

Operating Mode	FR	CL	$\overline{\text{DOF}}$
Master (M/S = HIGH) The internal oscillator circuit is enabled (CLS = HIGH) The internal oscillator circuit is disabled (CLS = LOW)	Output Output	Output Input	Output Output
Slave (M/S = LOW) Set the CLS pin to the same level as with the master.	Input Input	Input Input	Input Input

### The Common Output Status Select Circuit

In the S1D10605 Series chips, the COM output scan direction can be selected by the common output status select command. (See Table 6.) Consequently, the constraints in IC layout at the time of LCD module assembly can be minimized.

Table 6

Status	COM Scan Direction				
	S1D10605*****	S1D10606*****	S1D10607*****	S1D10608*****	S1D10609*****
Normal	COM0 → COM63	COM0 → COM47	COM0 → COM31	COM0 → COM53	COM0 → COM51
Reverse	COM63 → COM0	COM47 → COM0	COM31 → COM0	COM53 → COM0	COM51 → COM0

### The Liquid Crystal Driver Circuits

These are a 197-channel (S1D10605 Series), a 181-channel (S1D10606 Series) multiplexers 165-channel (S1D10607 Series), a 187-channel (S1D10608 Series), and a 185-channel (S1D10609 Series) that generate four voltage levels for driving the liquid crystal. The combination of the display data, the COM scan signal, and the FR signal produces the liquid crystal drive voltage output.

Figure 6 shows examples of the SEG and COM output wave form.

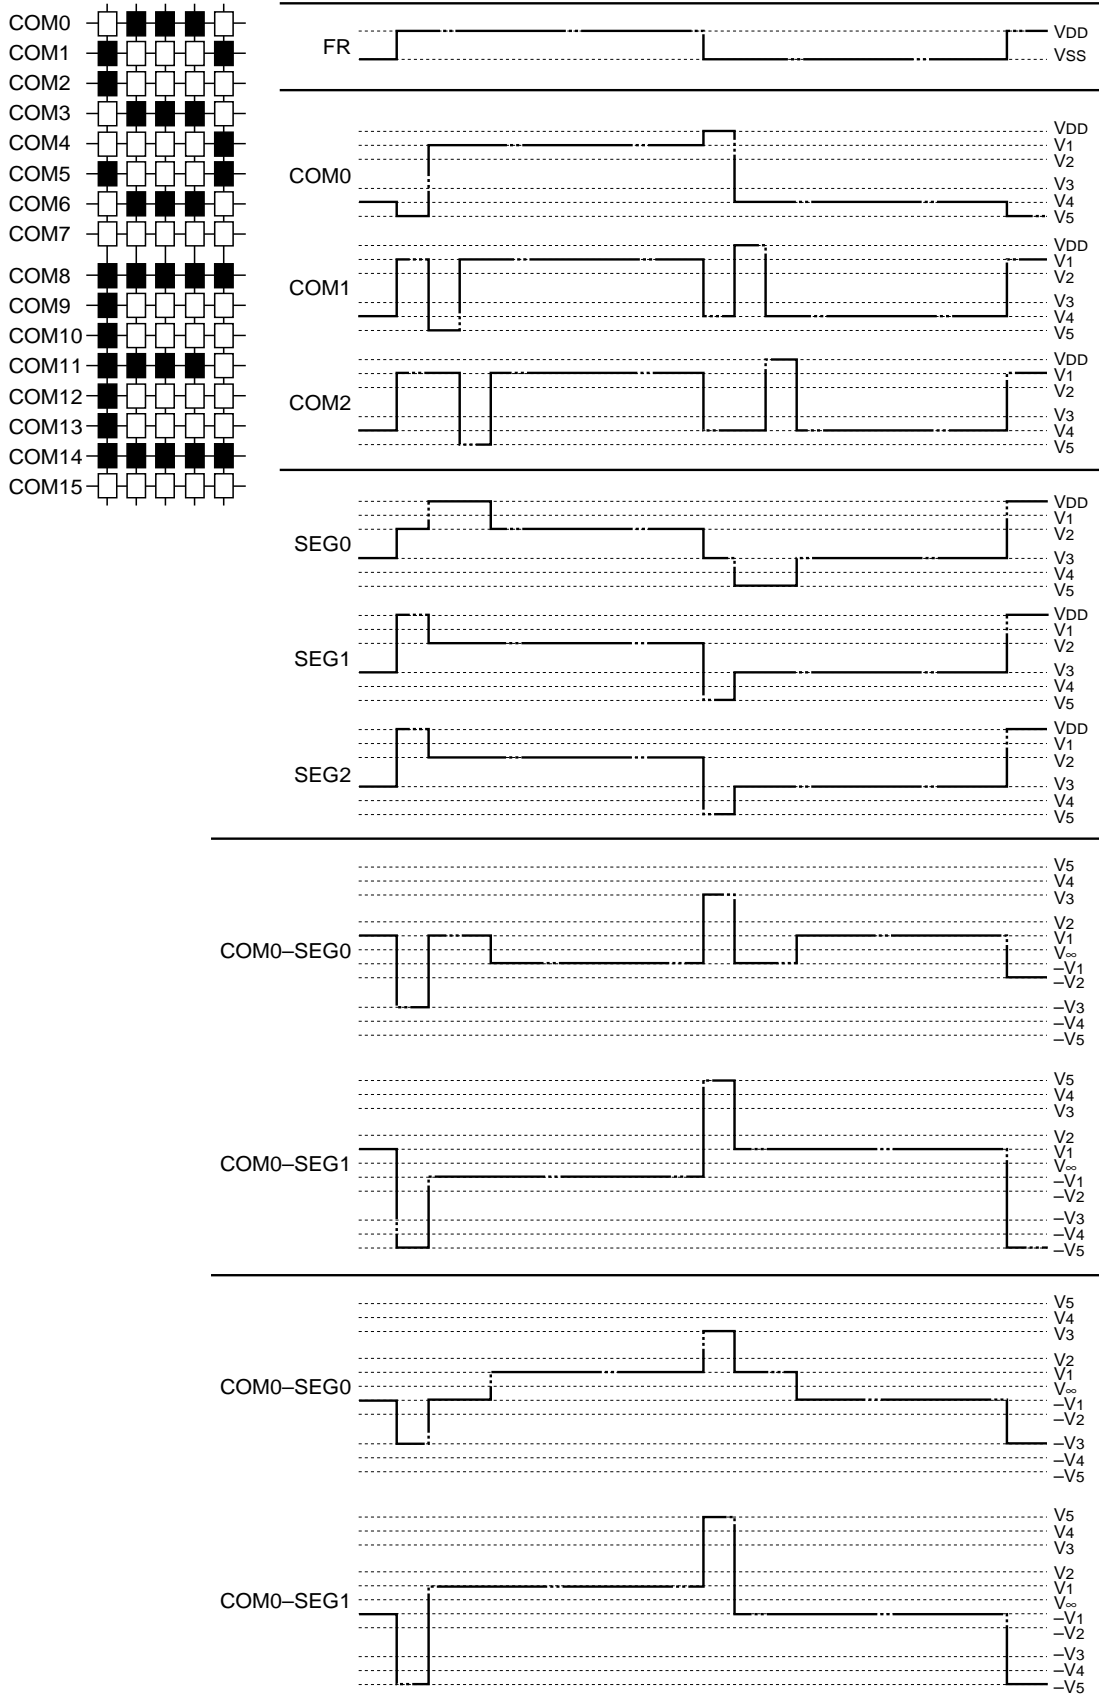

Figure 6

## The Power Supply Circuits

The power supply circuits are low-power consumption power supply circuits that generate the voltage levels required for the liquid crystal drivers. They comprise Booster circuits, voltage regulator circuits, and voltage follower circuits. They are only enabled in master operation.

The power supply circuits can turn the Booster circuits, the voltage regulator circuits, and the voltage follower circuits ON or OFF independently through the use of the Power Control Set command. Consequently, it is possible to make an external power supply and the internal power supply function somewhat in parallel. Table 7 shows the Power Control Set Command 3-bit data control function, and Table 8 shows reference combinations.

**Table 7 The Control Details of Each Bit of the Power Control Set Command**

Item	Status	
	"1"	"0"
D2 Booster circuit control bit	ON	OFF
D1 Voltage regulator circuit (V regulator circuit) control bit	ON	OFF
D0 Voltage follower circuit (V/F circuit) control bit	ON	OFF

**Table 8 Reference Combinations**

Use Settings	D2	D1	D0	Step-up circuit	V regulator circuit	V/F circuit	External voltage input	Step-up voltage system terminal
① Only the internal power supply is used	1	1	1	O	O	O	VSS2	Used
② Only the V regulator circuit and the V/F circuit are used	0	1	1	X	O	O	VOUT, VSS2	Open
③ Only the V/F circuit is used	0	0	1	X	X	O	V5, VSS2	Open
④ Only the external power supply is used	0	0	0	X	X	X	V1 to V5	Open

\* The "step-up system terminals" refer CAP1+, CAP1-, CAP2+, CAP2-, and CAP3-.

\* While other combinations, not shown above, are also possible, these combinations are not recommended because they have no practical use.

## The Step-up Voltage Circuits

Using the step-up voltage circuits equipped within the S1D10605 Series chips it is possible to produce a Quad step-up, a Triple step-up, and a Double step-up of the VDD – VSS2 voltage levels.

**Quad step-up:** Connect capacitor C1 between CAP1+ and CAP1-, between CAP2+ and CAP2-, between CAP1+ and CAP3-, and between VSS2 and VOUT, to produce a voltage level in the negative direction at the VOUT terminal that is 4 times the voltage level between VDD and VSS2.

**Triple step-up:** Connect capacitor C1 between CAP1+ and CAP1-, between CAP2+ and CAP2- and between VSS2 and VOUT, and short between CAP3- and VOUT to produce a voltage level in the negative direction at the VOUT terminal that is 3 times the voltage difference between VDD and VSS2.

**Double step-up:** Connect capacitor C1 between CAP1+ and CAP1-, and between VSS2 and VOUT, leave CAP2+ open, and short between CAP2-, CAP3- and VOUT to produce a voltage in the negative direction at the VOUT terminal that is twice the voltage between VDD and VSS2.

The step-up voltage relationships are shown in Figure 7.

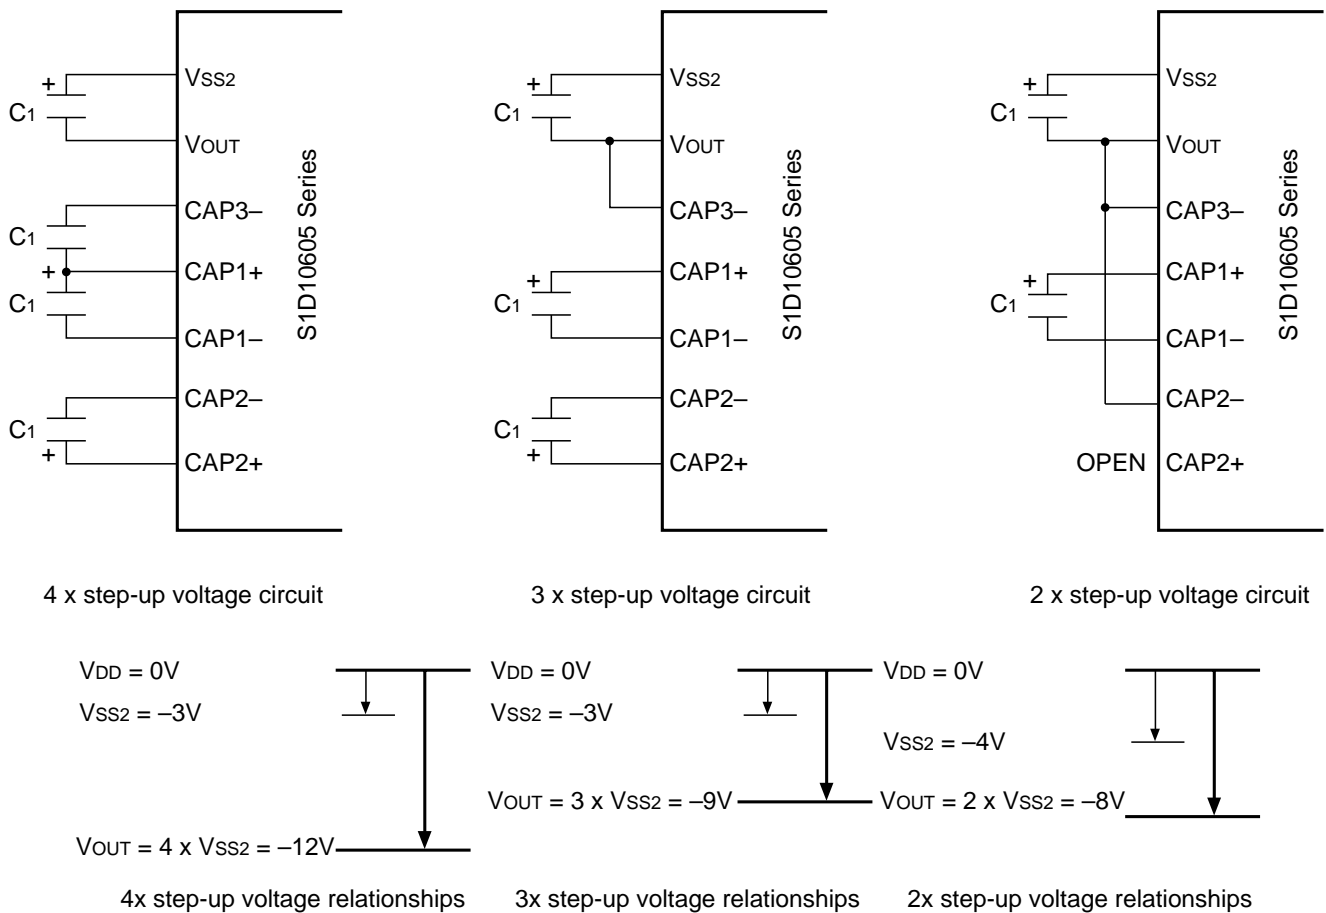

Figure 7

- \* The VSS2 voltage range must be set so that the VOUT terminal voltage does not exceed the absolute maximum rated value.
- \* Low VDD - VSS voltage causes decrease in efficiency of step-up. Usage above 2.4V for VDD - VSS is recommended.

### The Voltage Regulator Circuit

The step-up voltage generated at VOUT outputs the liquid crystal driver voltage V5 through the voltage regulator circuit. Because the S1D10605 Series chips have an internal high-accuracy fixed voltage power supply with a 64-level electronic volume function and internal resistors for the V5 voltage regulator, systems can be constructed without having to include high-accuracy voltage regulator circuit components.

Moreover, in the S1D10605 Series, thermal gradients have been prepared as VREG options: approximately  $-0.05\%/^{\circ}C$ .

#### (A) When the V5 Voltage Regulator Internal Resistors Are Used

Through the use of the V5 voltage regulator internal resistors and the electronic volume function the liquid crystal power supply voltage V5 can be controlled by commands alone (without adding any external resistors), making it possible to adjust the liquid crystal display brightness. The V5 voltage can be calculated using equation A-1 over the range where  $|V5| < |VOUT|$ .

$$\begin{aligned}
 V_5 &= \left(1 + \frac{R_b}{R_a}\right) \cdot V_{EV} \\
 &= \left(1 + \frac{R_b}{R_a}\right) \cdot \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \\
 \left[ \because V_{EV} &= \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \right] \quad \text{(Equation A-1)}
 \end{aligned}$$

Figure 8

VREG is the IC-internal fixed voltage supply, and its voltage at Ta = 25°C is as shown in Table 9.

Table 9

Equipment Type	Thermal Gradient	Units	VREG	Units
Internal Power Supply	-0.05	[%/°C]	-2.1	[V]

α is set to 1 level of 64 possible levels by the electronic volume function depending on the data set in the 6-bit electronic volume register. Table 10 shows the value for α depending on the electronic volume register settings.

Rb/Ra is the V5 voltage regulator internal resistor ratio, and can be set to 8 different levels through the V5 voltage regulator internal resistor ratio set command. The (1 + Rb/Ra) ratio assumes the values shown in Table 11 depending on the 3-bit data settings in the V5 voltage regulator internal resistor ratio register.

Table 10

D5	D4	D3	D2	D1	D0	α

For the internal resistance ratio, a manufacturing dispersion of up to  $\pm 7\%$  should be taken into account. When not within the tolerance, adjust the V5 voltage by externally mounting  $R_a$  and  $R_b$ .

Figs. 9 (for S1D10605 Series), Figs. 10 (for S1D10606 Series) Figs. 11 (for S1D10607 Series), Figs.12 (for S1D10608\*\*\*\*\*) and Figs. 13 (for S1D10609 Series). show V5 voltage measured by values of the internal resistance ratio resistor for V5 voltage adjustment and electric volume resistor for each temperature grade model, when  $T_a = 25\text{ }^\circ\text{C}$ .

Figure 9: S1D10605D00B\* For Models Where the Thermal Gradient =  $-0.05\%/^{\circ}\text{C}$

The  $V_5$  voltage as a function of the  $V_5$  voltage regulator internal resistor ratio register and the electronic volume register.

Figure 10: S1D10606D00B\* For Models Where the Thermal Gradient =  $-0.05\%/^{\circ}\text{C}$

The  $V_5$  voltage as a function of the  $V_5$  voltage regulator internal resistor ratio register and the electronic volume register.

The  $V_5$  voltage as a function of the  $V_5$  voltage regulator internal resistor ratio register and the electronic volume register.

Figure 13: S1D10609D00B\* Temperature Gradient = -0.05%/°C Model

The V<sub>5</sub> voltage as a function of the V<sub>5</sub> voltage regulator internal resistor ratio register and the electronic volume register.

Setup example: When selecting Ta = 25°C and V<sub>5</sub> = 7 V for an S1D10607 model on which Temperature gradient = -0.05%/°C.

Using Figure 15 and the equation A-1, the following setup is enabled.

At this time, the variable range and the notch width of the V<sub>5</sub> voltage is, as shown Table 13, as dependent on the electronic volume.

Table 12

Contents	Register					
	D5	D4	D3	D2	D1	D0
For V <sub>5</sub> voltage regulator	—	—	—	0	1	0
Electronic Volume	1	0	0	1	0	1

Table 13

V <sub>5</sub>	Min.	Typ.	Max.	Units
Variable Range	-8.4 (63 levels)	-6.8 (central value)	-5.1 (0 level)	[V]
Notch width		51		[mV]

**(B) When an External Resistance is Used  
(i.e., The V5 Voltage Regulator Internal Resistors Are Not Used) (1)**

The liquid crystal power supply voltage V5 can also be set without using the V5 voltage regulator internal resistors (IRS terminal = LOW) by adding resistors Ra' and Rb' between VDD and VR, and between VR and V5, respectively. When this is done, the use of the electronic volume function makes it possible to adjust the brightness of the liquid crystal display by controlling the liquid crystal power supply voltage V5 through commands.

In the range where |V5| < |VOUT|, the V5 voltage can be calculated using equation B-1 based on the external resistances Ra' and Rb'.

$$\begin{aligned}
 V_5 &= \left(1 + \frac{R_{b'}}{R_{a'}}\right) \cdot V_{EV} \\
 &= \left(1 + \frac{R_{b'}}{R_{a'}}\right) \cdot \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \\
 \left[ \because V_{EV} &= \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \right] \quad \text{(Equation B-1)}
 \end{aligned}$$

Figure 14

Setup example: When selecting Ta = 25°C and V5 = -7 V for an S1D10607 Series model where the temperature gradient = -0.05%/°C.

When the central value of the electron volume register is (D5, D4, D3, D2, D1, D0) = (1, 0, 0, 0, 0, 0), then α = 31 and VREG = -2.1 V so, according to equation B-1,

$$\begin{aligned}
 V_5 &= \left(1 + \frac{R_{b'}}{R_{a'}}\right) \cdot \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \\
 -11V &= \left(1 + \frac{R_{b'}}{R_{a'}}\right) \cdot \left(1 - \frac{31}{162}\right) \cdot (-2.1) \quad \text{(Equation B-2)}
 \end{aligned}$$

Moreover, when the value of the current running through Ra' and Rb' is set to 5 μA,

$$R_{a'} + R_{b'} = 1.4M\Omega \quad \text{(Equation B-3)}$$

Consequently, by equations B-2 and B-3,

$$\begin{aligned}
 \frac{R_{b'}}{R_{a'}} &= 3.12 \\
 R_{a'} &= 340k\Omega \\
 R_{b'} &= 1060k\Omega
 \end{aligned}$$

At this time, the V5 voltage variable range and notch width, based on the electron volume function, is as given in Table 14.

Table 14

V5	Min.	Typ.	Max.	Units
Variable Range	-8.6 (63 levels)	-7.0 (central value)	-5.3 (0 level)	[V]
Notch width		52		[mV]

**(C) When External Resistors are Used****(i.e. The V5 Voltage Regulator Internal Resistors Are Not Used). (2)**

When the external resistor described above are used, adding a variable resistor as well makes it possible to perform fine adjustments on Ra' and Rb', to set the liquid crystal drive voltage V5. In this case, the use of the electronic volume function makes it possible to control the liquid crystal power supply voltage V5 by commands to adjust the liquid crystal display brightness.

In the range where  $|V_5| < |V_{OUT}|$  the V5 voltage can be calculated by equation C-1 below based on the R1 and R2 (variable resistor) and R3 settings, where R2 can be subjected to fine adjustments ( $\Delta R_2$ ).

$$\begin{aligned} V_5 &= \left(1 + \frac{R_3 + R_2 - \Delta R_2}{R_1 + \Delta R_2}\right) \cdot V_{EV} \\ &= \left(1 + \frac{R_3 + R_2 - \Delta R_2}{R_1 + \Delta R_2}\right) \cdot \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG} \\ &[\because V_{EV} = \left(1 - \frac{\alpha}{162}\right) \cdot V_{REG}] \end{aligned} \quad \text{(Equation C-1)}$$

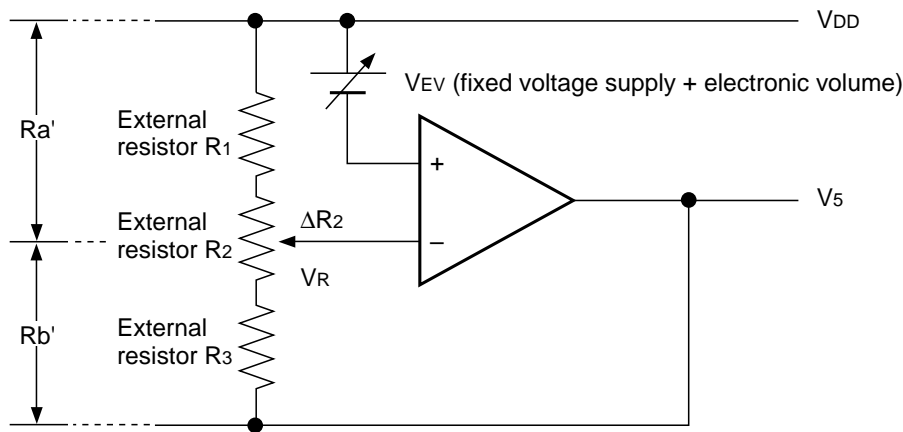

Figure 15

Setup example: When selecting  $T_a = 25^\circ\text{C}$  and  $V_5 = -5$  to  $-9$  V (using R2) for an S1D10607 model where the temperature gradient =  $-0.05\%/^\circ\text{C}$ .

When the central value for the electronic volume register is set at (D5, D4, D3, D2, D1, D0) = (1, 0, 0, 0, 0, 0),

$$\alpha = 31$$

$$V_{REG} = -2.1\text{V}$$

so, according to equation C-1, when  $\Delta R_2 = 0 \Omega$ , in order to make  $V_5 = -9$  V,

$$\begin{aligned} -9\text{V} &= \left(1 + \frac{R_3 + R_2}{R_1}\right) \cdot \left(1 - \frac{31}{162}\right) \cdot (-2.1) \\ &\text{(Equation C-2)} \end{aligned}$$

When  $\Delta R_2 = R_2$ , in order to make  $V = -5$  V,

$$\begin{aligned} -5\text{V} &= \left(1 + \frac{R_3}{R_1 + R_2}\right) \cdot \left(1 - \frac{31}{162}\right) \cdot (-2.1) \\ &\text{(Equation C-3)} \end{aligned}$$

Moreover, when the current flowing VDD and V5 is set to  $5 \mu\text{A}$ ,

$$R_1 + R_2 + R_3 = 1.4\text{M}\Omega \quad \text{(Equation C-4)}$$

With this, according to equation C-2, C-3 and C-4,

$$R_1 = 264\text{k}\Omega$$

$$R_2 = 211\text{k}\Omega$$

$$R_3 = 925\text{k}\Omega$$

At this time, the V5 voltage variable range and notch width based on the electron volume function is as shown in Table 15.

Table 15

V5	Min.	Typ.	Max.	Units
Variable Range	-8.7 (63 levels)	-7.0 (central value)	-5.3 (0 level)	[V]
Notch width		53		[mV]

- \* When the V5 voltage regulator internal resistors or the electronic volume function is used, it is necessary to at least set the voltage regulator circuit and the voltage follower circuit to an operating mode using the power control set commands. Moreover, it is necessary to provide a voltage from VOUT when the Booster circuit is OFF.
- \* The VR terminal is enabled only when the V5 voltage regulator internal resistors are not used (i.e. the IRS terminal = LOW). When the V5 voltage regulator internal resistors are used (i.e. when the IRS terminal = HIGH), then the VR terminal is left open.
- \* Because the input impedance of the VR terminal is high, it is necessary to take into consideration short leads, shield cables, etc. to handle noise.

**The Liquid Crystal Voltage Generator Circuit**

The V5 voltage is produced by a resistive voltage divider within the IC, and can be produced at the V1, V2, V3, and V4 voltage levels required for liquid crystal driving. Moreover, when the voltage follower changes the impedance, it provides V1, V2, V3 and V4 to the liquid crystal drive circuit. 1/9 bias or 1/7 bias for S1D10605 Series, 1/8 bias or 1/6 bias for S1D10606 Series, 1/6 bias or 1/5 bias for the S1D10607 Series 1/8 bias or 1/6 bias for S1D10608 Series and 1/8 bias or 1/6 bias for S1D10609 Series can be selected.

**High Power Mode**

The power supply circuit equipped in the S1D10605 Series chips has very low power consumption (normal mode:  $\overline{\text{HPM}}$  = HIGH). However, for LCDs or panels with large loads, this low-power power supply may cause display quality to degrade. When this occurs, setting the HPM terminal to LOW (high power mode) can improve the quality of the display. We recommend that the display be checked on actual equipment to determine whether or not to use this mode. Moreover, if the improvement to the display is inadequate even after high power mode has been set, then it is necessary to add a liquid crystal drive power supply externally.

**The Internal Power Supply Shutdown Command Sequence**

The sequence shown in Figure 16 is recommended for shutting down the internal power supply, first placing the power supply in power saver mode and then turning the power supply OFF.

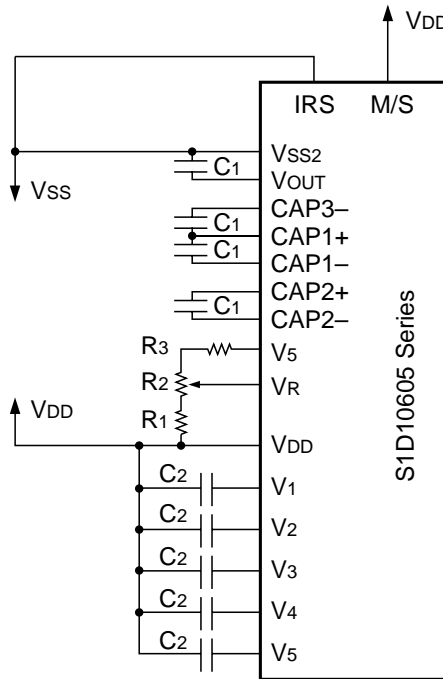

Figure 16

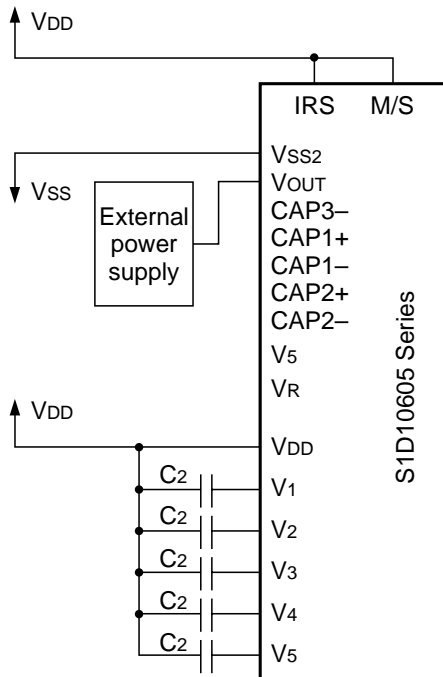

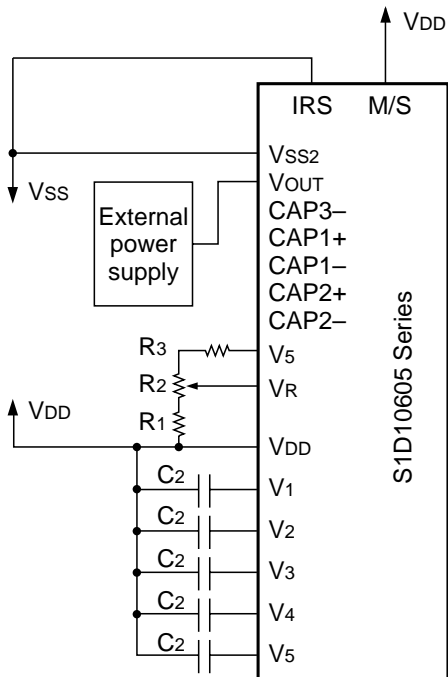

Reference Circuit Examples

Figure 17 shows reference circuit examples.

- ① When used all of the step-up circuit, voltage regulating circuit and V/F circuit
  - (1) When the voltage regulator internal resistor is used.  
(Example where  $V_{SS2} = V_{SS}$ , with 4x step-up)
  - (2) When the voltage regulator internal resistor is not used.  
(Example where  $V_{SS2} = V_{SS}$ , with 4x step-up)

- ② When the voltage regulator circuit and V/F circuit alone are used
  - (1) When the V5 voltage regulator internal resistor is not used.
  - (2) When the V5 voltage regulator internal resistor is used.

③ When the V/F circuit alone is used

④ When the built-in power is not used

⑤ When the built-in power circuit is used to drive a liquid crystal panel heavily loaded with AC or DC, it is recommended to connect an external resistor to stabilize potentials of V1, V2, V3 and V4 which are output from the built-in voltage follower.

Examples of shared reference settings  
When V5 can vary between -8 and 12 V

Item	Set value	Units
C1	1.0 to 4.7	μF
C2	0.01 to 1.0	μF

Reference set value R4: 100kΩ to 1MΩ  
It is recommended to set an optimum resistance value R4 taking the liquid crystal display and the drive waveform.

Figure 17

- \* 1 Because the VR terminal input impedance is high, use short leads and shielded lines.
- \* 2 C1 and C2 are determined by the size of the LCD being driven. Select a value that will stabilize the liquid crystal drive voltage.
- \* 3 When using external power supply, large current flows during  $\overline{\text{RES}} = \text{LOW}$ . Please be careful.

Example of the Process by which to Determine the Settings:

- Turn the voltage regulator circuit and voltage follower circuit ON and supply a voltage to VOUT from the outside.
- Determine C2 by displaying an LCD pattern with a heavy load (such as horizontal stripes) and selecting a C2 that stabilizes the liquid crystal drive voltages (V1 to V5). Note that all C2 capacitors must have the same capacitance value.
- Next turn all the power supplies ON and determine C1.

\* Precautions when installing the COG

When installing the COG, it is necessary to duly consider the fact that there exists a resistance of the ITO wiring occurring between the driver chip and the externally connected parts (such as capacitors and resistors). By the influence of this resistance, non-conformity may occur with the indications on the liquid crystal display.

Therefore, when installing the COG design the module paying sufficient considerations to the following three points.

1. Suppress the resistance occurring between the driver chip pin to the externally connected parts as much as possible.
2. Suppress the resistance connecting to the power supply pin of the driver chip.
3. Make various COG module samples with different ITO sheet resistance to select the module with the sheet resistance with sufficient operation margin.

Also, as for this driver IC, pay sufficient attention to the following points when connecting to external parts for the characteristics of the circuit.

1. Connection to the boosting capacitors The boosting capacitors (the capacitors connecting to respective CAP pins and capacitor being inserted between V<sub>OUT</sub> and V<sub>SS2</sub>) of this IC are being switched over by use of the transistor with very low ON-resistance of about 10Ω. However, when installing the COG, the resistance of ITO wiring is being inserted in series with the switching transistor, thus dominating the boosting ability.

Consequently, the boosting ability will be hindered as a result and pay sufficient attention to the wiring to respective boosting capacitors.

2. Connection of the smoothing capacitors for the liquid crystal drive

The smoothing capacitors for the liquid crystal driving potentials (V<sub>1</sub>, V<sub>2</sub>, V<sub>3</sub> and V<sub>4</sub>) are indispensable for liquid crystal drives not only for the purpose of mere stabilization of the voltage levels. If the ITO wiring resistance which occurs pursuant to installation of the COG is supplemented to these smoothing capacitors, the liquid crystal driving potentials become unstable to cause non-conformity with the indications of the liquid crystal display. Therefore, when using the COG module, we definitely recommend to connect reinforcing resistors externally.

Reference value of the resistance is 100kΩ to 1MΩ.

Meanwhile, because of the existence of these reinforcing resistors, current consumption will increase.

Indicated below is an exemplary connection diagram of external resistors.

Please make sufficient evaluation work for the display statuses with any connection tests.

Exemplary connection diagram 1.

Exemplary connection diagram 2.

### The Reset Circuit

When the  $\overline{\text{RES}}$  input comes to the LOW level, these LSIs return to the default state. Their default states are as follows:

1. Display OFF
2. Normal display
3. ADC select: Normal (ADC command D0 = LOW)
4. Power control register: (D2, D1, D0) = (0, 0, 0)
5. Serial interface internal register data clear
6. LCD power supply bias rate:
  - S1D10605\*\*\*\*\* ..... 1/9 bias
  - S1D10606\*\*\*\*\*, 10608\*\*\*\*\*,  
10609\*\*\*\*\* ..... 1/8 bias
  - S1D10607\*\*\*\*\* ..... 1/6 bias
7. All-indicator lamps-on OFF (All-indicator lamps ON/OFF command D0 = LOW)
8. Power saving clear
9. V5 voltage regulator internal resistors  $R_a$  and  $R_b$  separation  
(Internal resistors are connected while  $\overline{\text{RES}}$  is LOW.)
10. Output conditions of SEG and COM terminals  
SEG :  $V_2/V_3$ , COM :  $V_1/V_4$   
(Both the SEG terminal and the COM terminal output the VDA level while  $\overline{\text{RES}}$  is LOW.)
11. Read modify write OFF
12. Static indicator OFF  
Static indicator register : (D1, D2) = (0, 0)
13. Display start line set to first line
14. Column address set to Address 0
15. Page address set to Page 0
16. Common output status normal
17. V5 voltage regulator internal resistor ratio set mode clear
18. Electronic volume register set mode clear  
Electronic volume register : (D5, D4, D3, D2, D1, D0) = (1, 0, 0, 0, 0, 0)
19. Test mode clear

On the other hand, when the reset command is used, the above default settings from 11 to 19 are only executed.

When the power is turned on, the IC internal state becomes unstable, and it is necessary to initialize it using the  $\overline{\text{RES}}$  terminal. After the initialization, each input terminal should be controlled normally.

Moreover, when the control signal from the MPU is in the high impedance, an overcurrent may flow to the IC. After applying a current, it is necessary to take proper measures to prevent the input terminal from getting into the high impedance state.

If the internal liquid crystal power supply circuit is not used, it is necessary that  $\overline{\text{RES}}$  is HIGH when the external liquid crystal power supply is turned on. This IC has the function to discharge V5 when  $\overline{\text{RES}}$  is LOW, and the external power supply short-circuits to VDD when  $\overline{\text{RES}}$  is LOW.

While  $\overline{\text{RES}}$  is LOW, the oscillator and the display timing generator stop, and the CL, FR, FRS and  $\overline{\text{DOF}}$  terminals are fixed to HIGH. The terminals D0 to D7 are not affected. The VDD level is output from the SEG and COM output terminals. This means that an internal resistor is connected between VDD and V5.

## 8. COMMAND DESCRIPTION

The S1D10605 Series chips identify the data bus signals by a combination of A0,  $\overline{RD}$  (E),  $\overline{WR}$  (R/ $\overline{W}$ ) signals. Command interpretation and execution does not depend on the external clock, but rather is performed through internal timing only, and thus the processing is fast enough that normally a busy check is not required.

In the 8080 MPU interface, commands are launched by inputting a low pulse to the  $\overline{RD}$  terminal for reading, and inputting a low pulse to the  $\overline{WR}$  terminal for writing. In the 6800 Series MPU interface, the interface is placed in a read mode when an HIGH signal is input to the R/ $\overline{W}$  terminal and placed in a write mode when a LOW signal is input to the R/ $\overline{W}$  terminal and then the command is launched by inputting a high pulse to the E terminal. (See “11. Timing Characteristics” regarding the timing.) Consequently, the 6800 Series MPU interface is different than the 80x86 Series MPU interface in that in the explanation of commands and the display commands the status read and display data read  $\overline{RD}$  (E) becomes “1(H)”. In the explanations below the commands are explained using the 8080 Series MPU interface as the example.

When the serial interface is selected, the data is input in sequence starting with D7.

<Explanation of Commands>

### (1) Display ON/OFF

This command turns the display ON and OFF.

A0	E $\overline{RD}$	R/ $\overline{W}$ $\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	Setting
0	1	0	1	0	1	0	1	1	1	1	Display ON
										0	Display OFF

When the display OFF command is executed when in the display all points ON mode, power saver mode is entered. See the section on the (20) “power saver” for details.

### (2) Display Start Line Set

This command is used to specify the display start line address of the display data RAM shown in Figure 4. For further details see the 7. FUNCTION DESCRIPTION in “The Line Address Circuit”.

A0	E $\overline{RD}$	R/ $\overline{W}$ $\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	Line address
0	1	0	0	1	0	0	0	0	0	0	0
					0	0	0	0	0	1	1
					0	0	0	0	1	0	2
								↓			↓
					1	1	1	1	1	0	62
					1	1	1	1	1	1	63

### (3) Page Address Set

This command specifies the page address corresponding to the low address when the MPU accesses the display data RAM (see Figure 4). Specifying the page address and column address enables to access a desired bit of the display data RAM. Changing the page address does not accompany a change in the status display. See the “page address” circuit in the 7. Function Description for the detail.

A0	E $\overline{RD}$	R/ $\overline{W}$ $\overline{WR}$	D7	D6	D5	D4	D3	D2	D1	D0	Page address
0	1	0	1	0	1	1	0	0	0	0	0
							0	0	0	1	1
							0	0	1	0	2
									↓		↓
							0	1	1	1	7
							1	0	0	0	8

**(4) Column Address Set**

This command specifies the column address of the display data RAM shown in Figure 4. The column address is split into two sections (the higher 4 bits and the lower 4 bits) when it is set (fundamentally, set continuously). Each time the display data RAM is accessed, the column address automatically increments (+1), making it possible for the MPU to continuously read from/write to the display data. The column address increment is topped at 83H. This does not change the page address continuously. See the 7. Function Description in “The Column Address Circuit,” for details.

		E R/W			D7 D6 D5 D4 D3 D2 D1 D0 A7 A6 A5 A4 A3 A2 A1 A0													Column address				
		A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	A7	A6	A5	A4	A3	A2	A1	A0		
High bits →		0	1	0	0	0	0	1	A7	A6	A5	A4	0	0	0	0	0	0	0	0	0	0
Low bits →								0	A3	A2	A1	A0	0	0	0	0	0	0	0	1	0	1
													0	0	0	0	0	0	1	0		2
																	↓					↓
													1	0	0	0	0	0	1	0		130
													1	0	0	0	0	0	1	1		131

**(5) Status Read**

		E R/W			D7 D6 D5 D4 D3 D2 D1 D0							
		A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
		0	0	1	BUSY	ADC	ON/OFF	RESET	0	0	0	0

BUSY	When BUSY = 1, it indicates that either processing is occurring internally or a reset condition is in process. While the chip does not accept commands until BUSY = 0, if the cycle time can be satisfied, there is no need to check for BUSY conditions.
ADC	This shows the relationship between the column address and the segment driver. 0: Reverse (column address 131-n ↔ SEG n) 1: Normal (column address n ↔ SEG n) (The ADC command switches the polarity.)
ON/OFF	ON/OFF: indicates the display ON/OFF state. 0: Display ON 1: Display OFF (This display ON/OFF command switches the polarity.)
RESET	This indicates that the chip is in the process of initialization either because of a $\overline{RES}$ signal or because of a reset command. 0: Operating state 1: Reset in progress

**(6) Display Data Write**

This command writes 8-bit data to the specified display data RAM address. Since the column address is automatically incremented by “1” after the write, the MPU can write the display data.

		E R/W			D7 D6 D5 D4 D3 D2 D1 D0							
		A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
		1	1	0	Write data							

**(7) Display Data Read**

This command reads 8-bit data from the specified display data RAM address. Since the column address is automatically incremented by “1” after the read, the CPU can continuously read multiple-word data. One dummy read is required immediately after the column address has been set. See the 7. Function Description in “Display Data RAM” for the explanation of accessing the internal registers. When the serial interface is used, reading of the display data becomes unavailable.

		E R/W			D7 D6 D5 D4 D3 D2 D1 D0							
		A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0
		1	0	1	Read Data							

**(8) ADC Select (Segment Driver Direction Select)**

This command can reverse the correspondence between the display RAM data column address and the segment driver output. Thus, sequence of the segment driver output pins may be reversed by the command. See the 7. Function Description “column address circuit” for the detail. Increment of the column address (by “1”) accompanying the reading or writing the display data is done according to the column address indicated in Figure 4.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Setting
	RD	WR									
0	1	0	1	0	1	0	0	0	0	0	Normal
										1	Reverse

**(9) Display Normal/Reverse**

This command can reverse the lit and unlit display without overwriting the contents of the display data RAM. When this is done the display data RAM contents are maintained.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Setting
	RD	WR									
0	1	0	1	0	1	0	0	1	1	0	RAM Data HIGH LCD ON voltage (normal)
										1	RAM Data LOW LCD ON voltage (reverse)

**(10) Display All Points ON/OFF**

This command makes it possible to force all display points ON regardless of the content of the display data RAM. The contents of the display data RAM are maintained when this is done. This command takes priority over the display normal/reverse command.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Setting
	RD	WR									
0	1	0	1	0	1	0	0	1	0	0	Normal display mode
										1	Display all points ON

When the display is in an OFF mode, executing the display all points ON command will place the display in power save mode. For details, see the (20) “Power Save section”.

**(11) LCD Bias Set**

This command selects the voltage bias ratio required for the liquid crystal display.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Select Status				
	RD	WR									\$S1D10605****	\$S1D10606****	\$S1D10607****	\$S1D10608****	\$S1D10609****
0	1	0	1	0	1	0	0	0	1	0	1/9 bias	1/8 bias	1/6 bias	1/8 bias	1/8 bias
										1	1/7 bias	1/6 bias	1/5 bias	1/6 bias	1/6 bias

**(12) Read/Modify/Write**

This command is used paired with the “END” command. Once this command has been input, the display data read command does not change the column address, but only the display data write command increments (+1) the column address. This mode is maintained until the END command is input. When the END command is input, the column address returns to the address it was at when the read/modify/write command was entered. This function makes it possible to reduce the load on the MPU when there are repeating data changes in a specified display region, such as when there is a blanking cursor.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0
	RD	WR								
0	1	0	1	1	1	0	0	0	0	0

\* Even in read/modify/write mode, other commands aside from display data read/write commands can also be used. However, the column address set command cannot be used.

- The sequence for cursor display

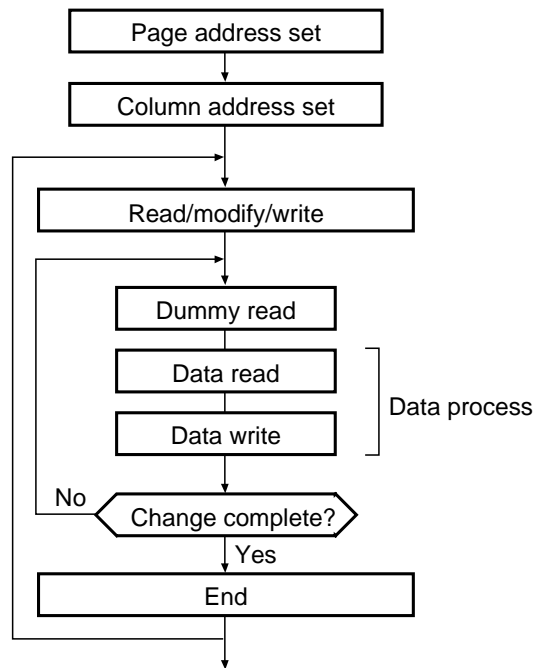

Figure 18

**(13) End**

This command releases the read/modify/write mode, and returns the column address to the address it was at when the mode was entered.

A0	$\overline{\text{E}}$	$\overline{\text{R/W}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	1	1	1	0

Figure 19

**(14) Reset**

This command initializes the display start line, the column address, the page address, the common output mode, the V5 voltage regulator internal resistor ratio, the electronic volume, and the static indicator are reset, and the read/modify/write mode and test mode are released. There is no impact on the display data RAM. See the 7. Function Description in “Reset” for details.

The reset operation is performed after the reset command is entered.

A0	$\overline{\text{E}}$	$\overline{\text{R/W}}$	D7	D6	D5	D4	D3	D2	D1	D0
0	1	0	1	1	1	0	0	0	1	0

The initialization when the power supply is applied must be done through applying a reset signal to the  $\overline{\text{RES}}$  terminal. The reset command must not be used instead.

**(15) Common Output Mode Select**

This command can select the scan direction of the COM output terminal. For details, see the 7. Function Description in “Common Output Mode Select Circuit.”

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Selected Mode

\* Disabled bit

**(16) Power Controller Set**

This command sets the power supply circuit functions. See the 7. Function Description in “The Power Supply Circuit,” for details

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Selected Mode
	RD	WR									
0	1	0	0	0	1	0	1	0			Booster circuit: OFF Booster circuit: ON
								0			Voltage regulator circuit: OFF Voltage regulator circuit: ON
								1			Voltage regulator circuit: ON
								0			Voltage follower circuit: OFF Voltage follower circuit: ON
								1			Voltage follower circuit: ON

[Translator's Note: the abbreviations explained within these parentheses for V and V/F have been written out in the English translation and are therefore no longer necessary.]

**(17) V5 Voltage Regulator Internal Resistor Ratio Set**

This command sets the V5 voltage regulator internal resistor ratio. For details, see the 7. Function Description is “The Power Supply Circuits.”

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Rb/Ra Ratio
	RD	WR									
0	1	0	0	0	1	0	0	0	0	0	Small
								0	0	1	
								0	1	0	
									↓		
								1	1	0	
								1	1	1	Large

**(18) The Electronic Volume (Double Byte Command)**

This command makes it possible to adjust the brightness of the liquid crystal display by controlling the liquid crystal drive voltage V5 through the output from the voltage regulator circuits of the internal liquid crystal power supply. This command is a two byte command used as a pair with the electronic volume mode set command and the electronic volume register set command, and both commands must be issued one after the other.

- The Electronic Volume Mode Set

When this command is input, the electronic volume register set command becomes enabled. Once the electronic volume mode has been set, no other command except for the electronic volume register command can be used. Once the electronic volume register set command has been used to set data into the register, then the electronic volume mode is released.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0
	RD	WR								
0	1	0	1	0	0	0	0	0	0	1

• Electronic Volume Register Set

By using this command to set six bits of data to the electronic volume register, the liquid crystal drive voltage V5 assumes one of the 64 voltage levels.

When this command is input, the electronic volume mode is released after the electronic volume register has been set.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	V5
	RD	WR									
0	1	0	*	*	0	0	0	0	0	1	Small

0	1	0	*	*	0	0	0	0	1	1	
						↓					↓
0	1	0	*	*	1	1	1	1	1	0	Large
0	1	0	*	*	1	1	1	1	1	1	

\* Inactive bit

When the electronic volume function is not used, set this to (1, 0, 0, 0, 0, 0)

• The Electronic Volume Register Set Sequence

Figure 20

**(19) Static Indicator (Double Byte Command)**

This command controls the static drive system indicator display. The static indicator display is controlled by this command only, and is independent of other display control commands.

This is used when one of the static indicator liquid crystal drive electrodes is connected to the FR terminal, and the other is connected to the FRS terminal. A different pattern is recommended for the static indicator electrodes than for the dynamic drive electrodes. If the pattern is too close, it can result in deterioration of the liquid crystal and of the electrodes.

The static indicator ON command is a double byte command paired with the static indicator register set command, and thus one must execute one after the other. (The static indicator OFF command is a single byte command.)

• Static Indicator ON/OFF

When the static indicator ON command is entered, the static indicator register set command is enabled. Once the static indicator ON command has been entered, no other command aside from the static indicator register set command can be used. This mode is cleared when data is set in the register by the static indicator register set command.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0	Static Indicator
	RD	WR									
0	1	0	1	0	1	0	1	1	0	0	OFF
										1	ON

• Static Indicator Register Set

This command sets two bits of data into the static indicator register, and is used to set the static indicator into a blinking mode.

E R/W			Indicator Display State								
A0	RD	WR	D7	D6	D5	D4	D3	D2	D1	D0	
0	1	0	*	*	*	*	*	*	0	0	OFF
									0	1	ON (blinking at approximately one second intervals)
									1	0	ON (blinking at approximately 0.5 second intervals)
									1	1	ON (constantly on)

\* Disabled bit

• Static Indicator Register Set Sequence

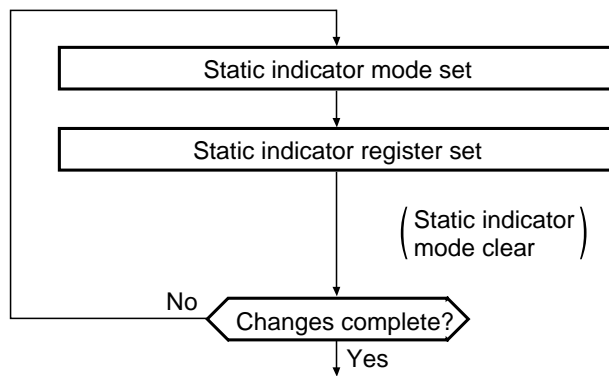

Figure 21

**(20) Power Save (Compound Command)**

When the display all points ON is performed while the display is in the OFF mode, the power saver mode is entered, thus greatly reducing power consumption.

The power saver mode has two different modes: the sleep mode and the standby mode. When the static indicator is OFF, it is the sleep mode that is entered. When the static indicator is ON, it is the standby mode that is entered.

In the sleep mode and in the standby mode, the display data is saved as is the operating mode that was in effect before the power saver mode was initiated, and the MPU is still able to access the display data RAM.

Refer to figure 22 for power save off sequence.

Figure 22

• Sleep Mode

This stops all operations in the LCD display system, and as long as there are no accesses from the MPU, the consumption current is reduced to a value near the static current. The internal modes during sleep mode are as follows:

- ① The oscillator circuit and the LCD power supply circuit are halted.
- ② All liquid crystal drive circuits are halted, and the segment in common drive outputs output a VDD level.

• Standby Mode

The duty LCD display system operations are halted and only the static drive system for the indicator continues to operate, providing the minimum required consumption current for the static drive. The internal modes are in the following states during standby mode.

- ① The LCD power supply circuits are halted. The oscillator circuit continues to operate.
- ② The duty drive system liquid crystal drive circuits are halted and the segment and common driver outputs output a VDD level. The static drive system does not operate.

When a reset command is performed while in standby mode, the system enters sleep mode.

\* When an external power supply is used, it is recommended that the functions of the external power supply circuit be stopped when the power saver mode is started. For example, when the various levels of liquid crystal drive voltage are provided by external resistive voltage dividers, it is recommended that a circuit be added in order to cut the electrical current flowing through the resistive voltage divider circuit when the power saver mode is in effect. The S1D10605 series chips have a liquid crystal display blanking control terminal  $\overline{DOF}$ . This terminal enters an LOW state when the power saver mode is launched. Using the output of  $\overline{DOF}$ , it is possible to stop the function of an external power supply circuit.

\* When the master is turned on, the oscillator circuit is operable immediately after the powering on.

**(21) NOP**

Non-Operation Command

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0
	RD	WR								
0	1	0	1	1	1	0	0	0	1	1

**(22) Test**

This is a command for IC chip testing. Please do not use it. If the test command is used by accident, it can be cleared by applying a LOW signal to the RES input by the reset command or by using an NOP.

A0	E R/W		D7	D6	D5	D4	D3	D2	D1	D0
	RD	WR								
0	1	0	1	1	1	1	*	*	*	*

\* Inactive bit

Note: The S1D10605 Series chips maintain their operating modes until something happens to change them. Consequently, excessive external noise, etc., can change the internal modes of the S1D10605 Series chip. Thus in the packaging and system design it is necessary to suppress the noise or take measure to prevent the noise from influencing the chip. Moreover, it is recommended that the operating modes be refreshed periodically to prevent the effects of unanticipated noise.

Table 16 Table of S1D10605 Series Commands

Command	Command Code										Function		
	A0	$\overline{RD}$	$\overline{WR}$	D7	D6	D5	D4	D3	D2	D1		D0

## 9. COMMAND DESCRIPTION

### Instruction Setup: Reference (reference)

#### (1) Initialization

Note: With this IC, when the power is applied, LCD driving non-selective potentials V<sub>2</sub> and V<sub>3</sub> (SEG pin) and V<sub>1</sub> and V<sub>4</sub> (COM pin) are output through the LCD driving output pins SEG and COM. When electric charge is remaining in the smoothing capacitor connecting between the LCD driving voltage output pins (V<sub>1</sub> to V<sub>5</sub>) and the V<sub>DD</sub> pin, the picture on the display may become totally dark instantaneously when the power is turned on. To avoid occurrence of such a failure, we recommend the following flow when turning on the power.

① When the built-in power is being used immediately after turning on the power:

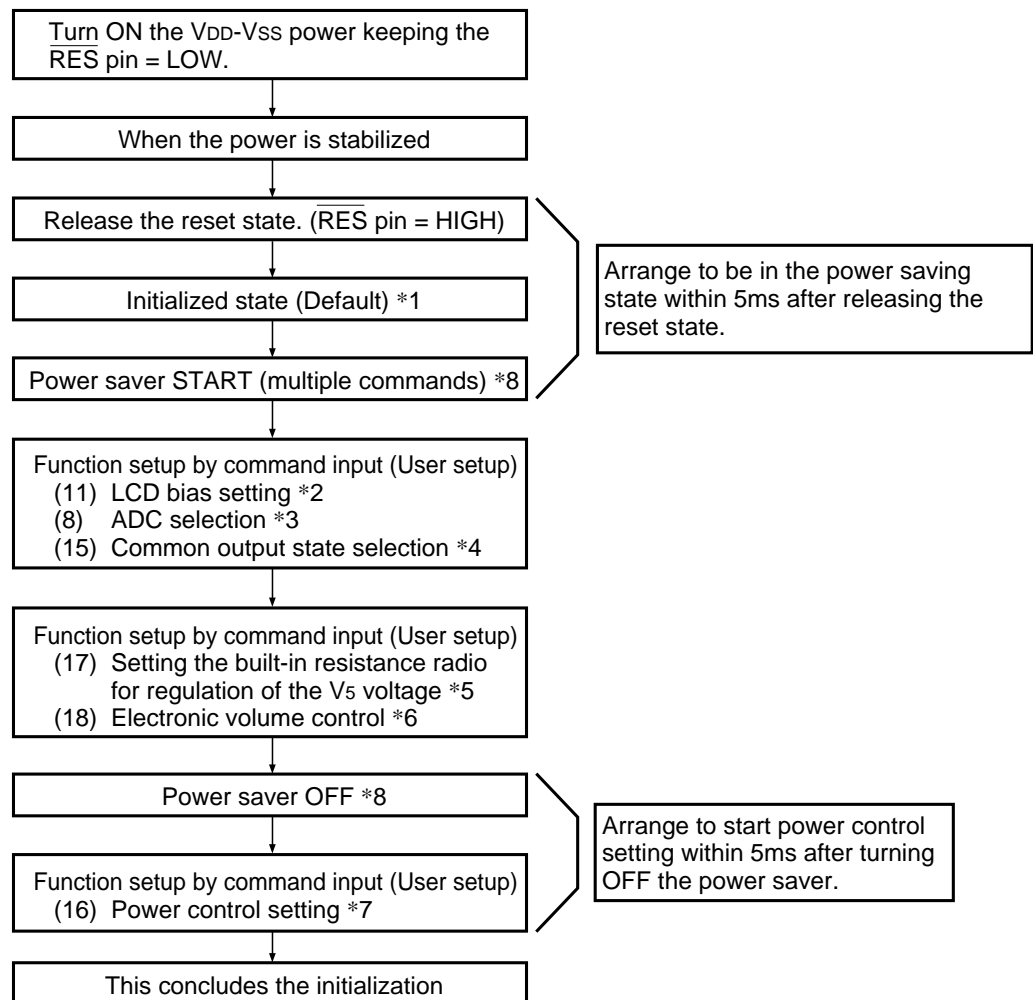

\* The target time of 5ms will result to vary depending on the panel characteristics and the capacitance of the smoothing capacitor. Therefore, we suggest you to conduct an operation check using the actual equipment.

Notes: Refer to respective sections or paragraphs listed below.

- \*1: 7. Function description; “Resetting circuit”
- \*2: 8. Command description; (11) “LCD bias setting”

- \*4: 8. Command description; (15) “Common output state selection”
- \*5: 7. Function description of functions; “Power circuit” & 8. Command description; (17) “Setting the built-in resistance ratio for regulation of the V<sub>5</sub> voltage”
- \*6: 7. Function description; “Power circuit” & 8. Command description; (18) “Electronic volume control”
- \*7: 7. Function description; “Power circuit” & 8. Command description; (16) “Power control setting”

② When the built-in power is not being used immediately after turning on the power:

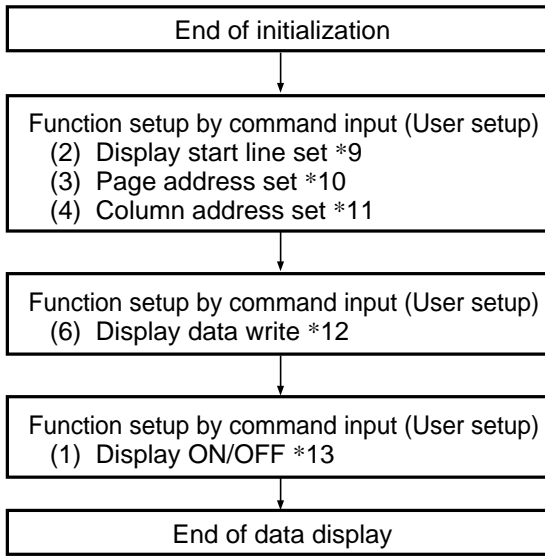

\* The target time of 5ms will result to vary depending on the panel characteristics and the capacitance of the smoothing capacitor. Therefore, we suggest you to conduct an operation check using the actual equipment.

Notes: Refer to respective sections or paragraphs listed below.

- \*1: 7. Function description; “Resetting circuit”
- \*2: 8. Command description; (11) “LCD bias setting”
- \*3: 8. Command description; (8) “ADC selection”
- \*4: 8. Command description; (15) “Common output state selection”
- \*5: 7. Function description; “Power circuit” & 8. Command description; “Setting the built-in resistance ratio for regulation of the V5 voltage”
- \*6: 7. Function description; “Power circuit” & 8. Command description; “Electronic volume control”
- \*7: 7. Function description; “Power circuit” & 8. Command description; “Power control setting”
- \*8: The power saver ON state can either be in sleep state or stand-by state.  
8. Command description; Power saver START (multiple commands)

(2) Data Display

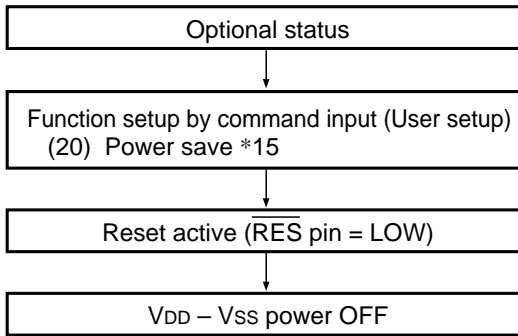

Notes: Reference items

- \*9: 8. Command Description; (2) “Display start line set”
- \*10: 8. Command Description; (3) “Page address set”
- \*11: 8. Command Description; (4) “Column address set”
- \*12: 8. Command Description; (6) “Display data write”
- \*13: 8. Command Description; (1) “Display ON/OFF”

Avoid displaying all the data at the data display start (when the display is ON) in white.

(3) Power OFF \*14

Set the time ( $t_L$ ) from reset active to turning off the  $V_{DD} - V_{SS}$  power ( $V_{DD} - V_{SS} = 1.8\text{ V}$ ) longer than the time ( $t_H$ ) when the potential of  $V_5$  to  $V_1$  becomes below the threshold voltage (approximately 1 V) of the LCD panel. For  $t_H$ , refer to the <Reference Data> of this event. When  $t_H$  is too long, insert a resistor between  $V_5$  and  $V_{DD}$  to reduce it.

Notes: Reference items

- \*14: The logic circuit of this IC’s power supply  $V_{DD} - V_{SS}$  controls the driver of the LCD power supply  $V_{DD} - V_5$ . So, if the power supply  $V_{DD} - V_{SS}$  is cut off when the LCD power supply  $V_{DD} - V_5$  has still any residual voltage, the driver (COM. SEG) may output any uncontrolled voltage. When turning off the power, observe the following basic procedures:
  - After turning off the internal power supply, make sure that the potential  $V_5$  to  $V_1$  has become below the threshold voltage of the LCD panel, and then turn off this IC’s power supply ( $V_{DD} - V_{SS}$ ).
- \*15: After inputting the power save command, be sure to reset the function using the  $\overline{RES}$  terminal until the power supply  $V_{DD} - V_{SS}$  is turned off. 7. Command Description (20) “Power Save”

### Refresh

It is recommended that the operating modes and display contents be refreshed periodically to prevent the effect of unexpected noise.

### Precautions on Turning off the power

Observe Paragraph 1) as the basic rule.

<Turning the power (VDD - VSS) off>

1) Power Save (The LCD powers (VDD - V5) are off.) → Reset input → Power (VDD - VSS) OFF

- Observe  $t_L > t_H$ .
- When  $t_L < t_H$ , an irregular display may occur.

Set  $t_L$  on the MPU according to the software.  $t_H$  is determined according to the external capacity C2 (smoothing capacity of V5 to V1) and the driver's discharging capacity.

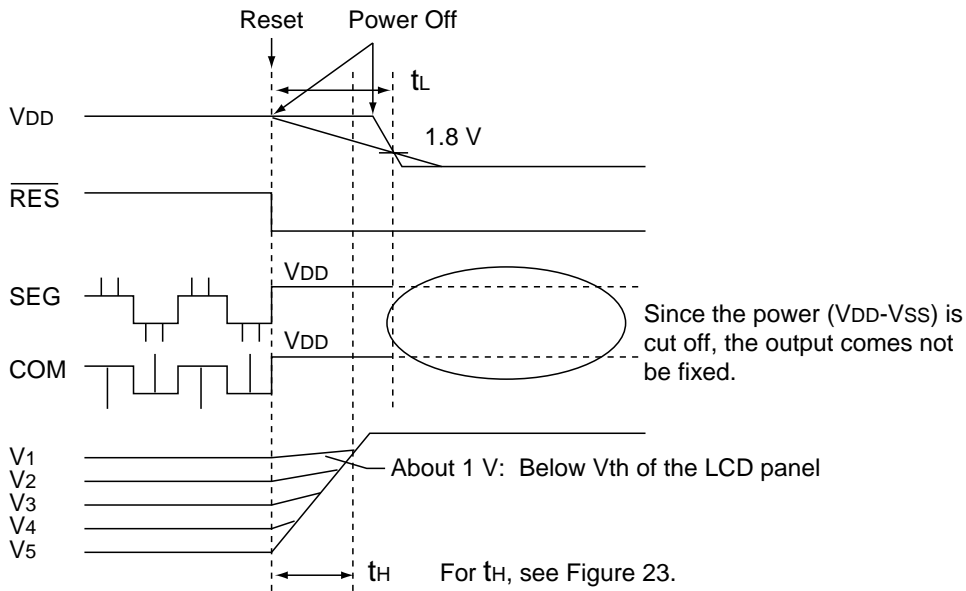

<Turning the power (VDD - VSS) off : When command control is not possible.>

2) Reset (The LCD powers (VDD - VSS) are off.) → Power (VDD - VSS) OFF

- Observe  $t_L > t_H$ .
- When  $t_L < t_H$ , an irregular display may occur.

For  $t_L$ , make the power (VDD - VSS) falling characteristics longer or consider any other method.  $t_H$  is determined according to the external capacity  $C_2$  (smoothing capacity of V5 to V1) and the driver's discharging capacity.

<Reference Data>

V5 voltage falling (discharge) time ( $t_H$ ) after the process of operation → power save → reset.

V5 voltage falling (discharge) time ( $t_H$ ) after the process of operation → reset.

Figure 23

## 10. ABSOLUTE MAXIMUM RATINGS

Unless otherwise noted,  $V_{SS} = 0\text{ V}$

Table 17

Parameter		Symbol	Conditions	Unit
Power Supply Voltage		$V_{DD}$	-0.3 to +6.0	V
Power supply voltage (2) ( $V_{DD}$ standard)		$V_{SS2}$	-4.0 to +0.3	V
Power supply voltage (3) ( $V_{DD}$ standard)		$V_5, V_{OUT}$	-18.0 to +0.3	V
Power supply voltage (4) ( $V_{DD}$ standard)		$V_1, V_2, V_3, V_4$	$V_5$ to +0.3	V
Input voltage		$V_{IN}$	-0.3 to $V_{DD} + 0.3$	V
Output voltage		$V_O$	-0.3 to $V_{DD} + 0.3$	V
Operating temperature		$T_{OPR}$	-40 to +85	°C
Storage temperature	TCP	$T_{STR}$	-55 to +100	°C
	Bare chip		-55 to +125	

Figure 24

### Notes and Cautions

1. The  $V_{SS2}$ ,  $V_1$  to  $V_5$  and  $V_{OUT}$  are relative to the  $V_{DD} = 0\text{ V}$  reference.
2. Insure that the voltage levels of  $V_1$ ,  $V_2$ ,  $V_3$ , and  $V_4$  are always such that  $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$ .
3. Permanent damage to the LSI may result if the LSI is used outside of the absolute maximum ratings. Moreover, it is recommended that in normal operation the chip be used at the electrical characteristic conditions, and use of the LSI outside of these conditions may not only result in malfunctions of the LSI, but may have a negative impact on the LSI reliability as well.

## 11. DC CHARACTERISTICS

Unless otherwise specified,  $V_{SS} = 0\text{ V}$ ,  $V_{DD} = 3.0\text{ V} \pm 10\%$ ,  $T_a = -40\text{ to }+85^\circ\text{C}$

Table 19

Item	Symbol	Condition		Rating			Units	Applicable Pin	
				Min.	Typ.	Max.			
Internal Power	Input voltage	VSS2	With Quad (Relative to VDD)		-4.0	—	-1.8	V	VSS2
	Supply Step-up output voltage Circuit	VOUT	(Relative to VDD)		-16.0	—	—	V	VOUT
	Voltage regulator Circuit Operating Voltage	VOUT	(Relative to VDD)		-16.0	—	-6.0	V	VOUT
	Voltage Follower Circuit Operating Voltage	V5	(Relative to VDD)		-14.0	—	-4.5	V	V5 *9
	Base Voltage	VREG0	Ta = 25°C	-0.05%/°C	-2.04	-2.10	-2.16	V	*10

- Note:
1. VDD=0V is assumed for voltage VSS, V1 to V5, and VOUT.
  2. Voltage V1, V2, V3 and V4 must always keep up the condition of  $V_{DD} \geq V_1 \geq V_2 \geq V_3 \geq V_4 \geq V_5$ .
  3. If the LSI exceeds its absolute maximum rating, it may cause permanent damage. It is desirable to use it under electrical conditions during general operation. Otherwise, a malfunction of the LSI may be caused and may affect LSI reliability.
  4. For the combined operating voltage of VDD and V5 systems, please refer to page 58, "Reference data 4,
    - Operating range of VDD and V5 systems."

## S1D10605 Series

- Dynamic Consumption Current (1), During Display, with the Internal Power Supply OFF  
Current consumed by total ICs when an external power supply is used.

S1D10605 Series Note: \*2

Temperature condition :  
 V<sub>DD</sub> - V<sub>SS</sub> = 1.8 to 2.2V : T<sub>a</sub> = -10 to +85°C  
 V<sub>DD</sub> - V<sub>SS</sub> = 2.2 to 3.6V : T<sub>a</sub> = -40 to +85°C

Figure 30

- The Relationship Between Oscillator Frequency  $f_{OSC}$ , Display Clock Frequency  $f_{CL}$  and the Liquid Crystal Frame Rate Frequency  $f_{FR}$

Table 25

	Item	fCL	fFR
S1D10605*****	When the internal oscillator circuit is used	$\frac{f_{OSC}}{4}$	$\frac{f_{OSC}}{4 \times 65}$
	When the internal oscillator circuit is not used	External input (fCL)	$\frac{f_{CL}}{260}$
S1D10606*****	When the internal oscillator circuit is used	$\frac{f_{OSC}}{8}$	$\frac{f_{OSC}}{8 \times 49}$
	When the internal oscillator circuit is not used	External input (fCL)	$\frac{f_{CL}}{196}$
S1D10607*****	When the internal oscillator circuit is used	$\frac{f_{OSC}}{8}$	$\frac{f_{OSC}}{8 \times 33}$
	When the internal oscillator circuit is not used	External input (fCL)	$\frac{f_{CL}}{264}$
S1D10608*****	When the internal oscillator circuit is used	$\frac{f_{OSC}}{8}$	$\frac{f_{OSC}}{8 \times 55}$
	When the internal oscillator circuit is not used	External input (fCL)	$\frac{f_{CL}}{220}$
S1D10609*****	When the internal oscillator circuit is used	$\frac{f_{OSC}}{8}$	$\frac{f_{OSC}}{8 \times 53}$
	When the internal oscillator circuit is not used	External input (fCL)	$\frac{f_{CL}}{212}$

(fFR is the liquid crystal alternating current period, and not the FR signal period.)

#### References for items market with \*

- \*1 While a broad range of operating voltages is guaranteed, performance cannot be guaranteed if there are sudden fluctuations to the voltage while the MPU is being accessed.
- \*2 The operating voltage range for the VDD system and the V5 system is as shown in Figure 30. This applies when the external power supply is being used.
- \*3 The A0, D0 to D5, D6 (SCL), D7 (SI),  $\overline{RD}$  (E),  $\overline{WR}$  (R/W),  $\overline{CS1}$ , CS2, CLS, CL, FR, M/S, C86, P/S,  $\overline{DOF}$ , RES, IRS, and HPM terminals.
- \*4 The D0 to D7, FR, FRS,  $\overline{DOF}$ , and CL terminals.
- \*5 The A0,  $\overline{RD}$  (E),  $\overline{WR}$  (R/W),  $\overline{CS1}$ , CS2, CLS, M/S, C86, P/S,  $\overline{RES}$ , IRS, and  $\overline{HPM}$  terminals.
- \*6 Applies when the D0 to D5, D6 (SCL), D7 (SI), CL, FR, and  $\overline{DOF}$  terminals are in a high impedance state.
- \*7 These are the resistance values for when a 0.1 V voltage is applied between the output terminal SEGn or COMn and the various power supply terminals (V1, V2, V3, and V4). These are specified for the operating voltage (3) range.  
 $R_{ON} = 0.1 \text{ V} / \Delta I$  (Where  $\Delta I$  is the current that flows when 0.1 V is applied while the power supply is ON.)
- \*8 See Table 9-7 for the relationship between the oscillator frequency and the frame rate frequency.
- \*9 The V5 voltage regulator circuit regulates within the operating voltage range of the voltage follower.
- \*10 This is the internal voltage reference supply for the V5 voltage regulator circuit. In the S1D10605 Series chips, the temperature range can come in three types as VREG options: (1) approximately  $-0.05\%/^{\circ}\text{C}$ , (2)  $-0.2\%/^{\circ}\text{C}$ , and (3) external input.
- \*11, 12 It indicates the current consumed on ICs alone when the internal oscillator circuit and display are turned on.  
 The S1D10605 is 1/9 biased, S1D10606/S1D10608/S1D10609 is 1/8 biased and S1D10607 is 1/6 biased.  
 Does not include the current due to the LCD panel capacity and wiring capacity.  
 Applicable only when there is no access from the MPU.
- \*12 It is the value on a model having the VREG option temperature gradient is  $-0.05\%/^{\circ}\text{C}$  when the V5 voltage regulator internal resistor is used.

Reset LOW pulse width	$\overline{\text{RES}}$	t <sub>RW</sub>		1	—	—	μs

Table 39

(V<sub>DD</sub> = 2.4 V to 3.0 V, T<sub>a</sub> = -40 to +85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		t <sub>R</sub>		—	—	1.3	μs
Reset LOW pulse width	$\overline{\text{RES}}$	t <sub>RW</sub>		1.3	—	—	μs

Table 40

(V<sub>DD</sub> = 1.8 V to 2.4 V, T<sub>a</sub> = -40 to +85°C)

Item	Signal	Symbol	Condition	Rating			Units
				Min.	Typ.	Max.	
Reset time		t <sub>R</sub>		—	—	1.5	μs
Reset LOW pulse width	$\overline{\text{RES}}$	t <sub>RW</sub>		1.5	—	—	μs

\*1 All timing is specified with 20% and 80% of V<sub>DD</sub> as the standard.

\*2 To reduce the reset noise, S1D10605D03B000, S1D10606D03B000, S1D10607D03B000, S1D10608D03B000, S1D10609D03B000 do not respond to the narrow reset low pulse (typically less than 75nsec.)

\*3 To reduce the reset noise, S1D10605D04B000, S1D10606D04B000, S1D10607D04B000, S1D10608D04B000, S1D10609D04B000 do not respond to the narrow reset low pulse (typically less than 350nsec).

## 12. THE MPU INTERFACE (REFERENCE EXAMPLES)

The S1D10605 Series can be connected to either 80 × 86 Series MPUs or to 6800 Series MPUs. Moreover, using the serial interface it is possible to operate the S1D10605 series chips with fewer signal lines. The display area can be enlarged by using multiple S1D10605 Series chips. When this is done, the chip select signal can be used to select the individual ICs to access.

Please note following when using semiconductor devices:

### "Cautions pertaining to light"

Semiconductor devices are highly sensitive to light, causing changes in their properties. Malfunctions may occur when light is applied to the IC. To avoid such malfunctions, please consider the following when installing to circuit boards or any other products.

- (1) Make sure the IC is installed in a light-resistant structure.
- (2) IC should be inspected under a light-resistant environment.
- (3) Make sure no light will be applied to all four surfaces of the IC chip.
